

Notes:

Topic 19

Quant \rightarrow means \rightarrow

pop	sample
μ	\bar{X}
St. dev. σ	S_x

cond:

- * $n \geq 30$ or pop. is normal
- * SRS from pop. of interest

$$\mu_{\bar{x}} = \mu$$

$$\sigma_{\bar{x}} = \frac{\sigma}{\sqrt{n}}$$

if given data:
L1
1-Var Stats

C.I.

$$\bar{X} \pm t^* \frac{S}{\sqrt{n}}$$

d.f. = $n - 1$
↓
degrees of freedom

$\frac{S}{\sqrt{n}}$ ← St. error

t-dist

- look like normal curves
- wider/fatter than normal dist.
- as n inc. / curve gets similar to normal
St. dev. dec.

★ use t^* instead of z^*
When you use S_x ($\frac{S}{\sqrt{n}}$)
Don't know σ ($\frac{\sigma}{\sqrt{n}}$)

19-3

$n = 130$

$\bar{x} = 98.249$

$s_x = 0.733$

d.f. = 129

95% C.I.

a)

$t_{\alpha/2}^* = 1.984$

$\bar{x} \pm t^* \left(\frac{s}{\sqrt{n}} \right)$

$98.249 \pm 1.984 \left(\frac{.733}{\sqrt{130}} \right)$

$1.9785 = t_{129}^*$

$98.249 \pm .1275$

$(98.12, 98.38)$

b)

I'm 95% conf. the true mean body temp. of healthy adults is in this interval.

19-8
19-11
