Range: \{3, 4, 16\}
27. Graph $y = x^2$. The graph passes the vertical line test. Thus, the equation represents a function.

28. Graph $y = x^3$. The graph passes the vertical line test. Thus, the equation represents a function.

29. Graph $y = \frac{1}{x}$. The graph passes the vertical line test. Thus, the equation represents a function.

30. Graph $y = |x|$. The graph passes the vertical line test. Thus, the equation represents a function.

31. $y^2 = 4 - x^2$

Solve for $y$: $y = \pm \sqrt{4 - x^2}$

For $x = 0$, $y = \pm 2$. Thus, $(0, 2)$ and $(0, -2)$ are on the graph. This is not a function, since a distinct $x$-value corresponds to two different $y$-values.

32. $y = \pm \sqrt{1 - 2x}$

For $x = 0$, $y = \pm 1$. Thus, $(0, 1)$ and $(0, -1)$ are on the graph. This is not a function, since a distinct $x$-value corresponds to two different $y$-values.

33. $x = y^2$

Solve for $y$: $y = \pm \sqrt{x}$

For $x = 1$, $y = \pm 1$. Thus, $(1, 1)$ and $(1, -1)$ are on the graph. This is not a function, since a distinct $x$-value corresponds to two different $y$-values.

34. $x + y^2 = 1$

Solve for $y$: $y = \pm \sqrt{1 - x}$

For $x = 0$, $y = \pm 1$. Thus, $(0, 1)$ and $(0, -1)$ are on the graph. This is not a function, since a distinct $x$-value corresponds to two different $y$-values.

35. Graph $y = 2x^2 - 3x + 4$. The graph passes the vertical line test. Thus, the equation represents a function.

36. Graph $y = \frac{3x - 1}{x + 2}$. The graph passes the vertical line test. Thus, the equation represents a function.

37. $2x^2 + 3y^2 = 1$

Solve for $y$: $2x^2 + 3y^2 = 1$

$3y^2 = 1 - 2x^2$

$y^2 = \frac{1 - 2x^2}{3}$

$y = \pm \frac{\sqrt{1 - 2x^2}}{\sqrt{3}}$

For $x = 0$, $y = \pm \frac{1}{\sqrt{3}}$. Thus, $\left(0, \frac{1}{\sqrt{3}}\right)$ and $\left(0, -\frac{1}{\sqrt{3}}\right)$ are on the graph. This is not a function, since a distinct $x$-value corresponds to two different $y$-values.
38. \( x^2 - 4y^2 = 1 \)

Solve for \( y \):

\[
4y^2 = x^2 - 1
\]
\[
y^2 = \frac{x^2 - 1}{4}
\]
\[
y = \pm \sqrt[2]{\frac{x^2 - 1}{4}}
\]

For \( x = \sqrt{2}, \ y = \pm \frac{1}{2} \). Thus, \( \left( \sqrt{2}, \frac{1}{2} \right) \) and \( \left( \sqrt{2}, -\frac{1}{2} \right) \) are on the graph. This is not a function, since a distinct \( x \)-value corresponds to two different \( y \)-values.

a. \( f(0) = 3(0)^2 + 2(0) - 4 = -4 \)

c. \( f(-1) = 3(-1)^2 + 2(-1) - 4 = 3 - 2 - 4 = -3 \)

d. \( f(-x) = 3(-x)^2 + 2(-x) - 4 = 3x^2 - 2x - 4 \)

e. \( -f(x) = -(3x^2 + 2x - 4) = -3x^2 - 2x + 4 \)

f. \( f(x+1) = 3(x+1)^2 + 2(x+1) - 4 \)
\[

f. \( f(x+1) = \frac{x+1}{(x+1)^2 + 1} \)
\[
= \frac{x+1}{x^2 + 2x + 1 + 1}
\]

h. \( f(x+h) = \frac{x+h}{(x+h)^2 + 1} = \frac{x+h}{x^2 + 2xh + h^2 + 1} \)
42. \( f(x) = \frac{x^2 - 1}{x + 4} \)

a. \( f(0) = \frac{0^2 - 1}{0 + 4} = \frac{-1}{4} = \frac{-1}{4} \)

= (-1.2x^2 + 220x) - (0.05x^3 - 2x^2 + 65x + 500)
= -1.2x^2 + 220x - 0.05x^3 + 2x^2 - 65x - 500
= -0.05x^3 + 0.8x^2 + 155x - 500
\]

b. \( P(15) = -0.05(15)^3 + 0.8(15)^2 + 155(15) - 500 \)
\[
= -168.75 + 180 + 2325 - 500
= 1836.25
\]

c. When 15 hundred cell phones are sold, the profit is $1836.25.

104. a. \( P(x) = R(x) - C(x) \)
\[
= 30x - (0.1x^2 + 7x + 400)
= 30x - 0.1x^2 - 7x - 400
= -0.1x^2 + 23x - 400
\]
\[ P(30) = -0.1(30)^2 + 23(30) - 400 \]
\[
= -90 + 690 - 400
= 200
\]

b. \( h(x) = 2x \)
\( h(a+b) = 2(a+b) = 2a + 2b \)
\( h(a) + h(b) = 2a + 2b \)
\( h(x) = 2x \) has the property.

105. a. \( g(x) = x^2 \)
\( g(a + b) = (a + b)^2 = a^2 + 2ab + b^2 \)
Since \( a^2 + 2ab + b^2 \neq a^2 + b^2 = g(a) + g(b) \),
\( g(x) = x^2 \) does not have the property.

b. \( F(x) = 5x - 2 \)
\( F(a + b) = 5(a + b) - 2 = 5a + 5b - 2 \)
Since \( 5a + 5b - 2 \neq 5a - 2 + 5b - 2 = F(a) + F(b) \),
\( F(x) = 5x - 2 \) does not have the property.

c. \( G(x) = \frac{1}{x} \)
\( G(a + b) = \frac{1}{a + b} \neq \frac{1}{a} + \frac{1}{b} = G(a) + G(b) \)
\( G(x) = \frac{1}{x} \) does not have the property.

29. \( h(x) = -\frac{44x^2}{v^2} + x + 6 \)

a. \( h(8) = -\frac{44(8)^2}{28^2} + (8) + 6 \\

b. \( h(12) = -\frac{44(12)^2}{28^2} + (12) + 6 \\
= -\frac{6336}{784} + 18 \\
= 9.9 \text{ feet}
\]

\( h(12) = 9.9 \) represents the height of the ball, in feet, after it has traveled 12 feet in front of the foul line.

c. From part (a) we know the point \((8,10.4)\) is on the graph and from part (b) we know the point \((12,9.9)\) is on the graph. We could evaluate the function at several more values of \( x \) (e.g. \( x = 0, x = 15, \) and \( x = 20 \)) to obtain additional points.

\[
h(0) = -\frac{44(0)^2}{28^2} + (0) + 6 = 6 \\
h(15) = -\frac{44(15)^2}{28^2} + (15) + 6 = 8.4 \\
h(20) = -\frac{44(20)^2}{28^2} + (20) + 6 = 3.6
\]

Some additional points are \((0,6), (15,8.4)\) and \((20,3.6)\). The complete graph is given
Section 2.2: The Graph of a Function

30. \( h(x) = -\frac{136x^2}{v^2} + 2.7x + 3.5 \)
   
   a. We want \( h(15) = 10 \).
   
   \[-\frac{136(15)^2}{v^2} + 2.7(15) + 3.5 = 10 \]
   
   \[-\frac{30,600}{v^2} = -34 \]
   
   \[v^2 = 900\]
   
   \[v = 30 \text{ ft/sec}\]
   
   The ball needs to be thrown with an initial velocity of 30 feet per second.

b. \( h(x) = -\frac{126x^2}{30^2} + 2.7x + 3.5 \)
   which simplifies to
   
   \[h(x) = -\frac{34}{225}x^2 + 2.7x + 3.5 \]

   c. Using the velocity from part (b),
   
   \[h(9) = -\frac{34}{225}(9)^2 + 2.7(9) + 3.5 = 15.56 \text{ ft} \]
   
   The ball will be 15.56 feet above the floor when it has traveled 9 feet in front of the foul line.

   d. Select several values for \( x \) and use these to find the corresponding values for \( h \). Use the results to form ordered pairs \((x, h)\). Plot the points and connect with a smooth curve.
   
   \( h(0) = -\frac{34}{225}(0)^2 + 2.7(0) + 3.5 = 3.5 \text{ ft} \)
   
   \( h(5) = -\frac{34}{225}(5)^2 + 2.7(5) + 3.5 = 13.2 \text{ ft} \)
   
   \( h(15) = -\frac{24}{225}(15)^2 + 2.7(15) + 3.5 = 10 \text{ ft} \)
   
   Thus, some points on the graph are \((0,3.5)\), \((5,13.2)\), and \((15,10)\). The complete graph is given below.

   ![Graph of a Function](image)

31. \( h(x) = -\frac{32x^2}{130^2} + x \)
   
   a. \( h(100) = -\frac{32(100)^2}{130^2} + 100 \)
   
   \[= -\frac{320,000}{16,900} + 100 = 81.07 \text{ feet} \]

   b. \( h(300) = -\frac{32(300)^2}{130^2} + 300 \)
   
   \[= -\frac{2,880,000}{16,900} + 300 = 129.59 \text{ feet} \]
Chapter 2: Functions and Their Graphs

c. \[ h(500) = \frac{-32(500)^2}{130^2} + 500 \]
\[ = \frac{-8,000,000}{16,900} + 500 = 26.63 \text{ feet} \]

\( h(500) = 26.63 \text{ feet} \) represents the height of the golf ball, in feet, after it has traveled a horizontal distance of 500 feet.

d. Solving \( h(x) = \frac{-32x^2}{130^2} + x = 0 \)
\[ -\frac{32x^2}{130^2} + x = 0 \]
\[ x\left(\frac{-32x}{130^2} + 1\right) = 0 \]
\[ x = 0 \text{ or } \frac{-32x}{130^2} + 1 = 0 \]
\[ 1 = \frac{32x}{130^2} \]
\[ 130^2 = 32x \]
\[ x = \frac{130^2}{32} = 528.13 \text{ feet} \]
Therefore, the golf ball travels 528.13 feet.

e. \[ y_1 = \frac{-32x^2}{130^2} + x \]

f. Use INTERSECT on the graphs of \( y_1 = \frac{-32x^2}{130^2} + x \) and \( y_2 = 90 \).

g. The ball travels approximately 275 feet before it reaches its maximum height of approximately 131.8 feet.

32. \[ A(x) = 4\sqrt{1-x^2} \]

a. Domain of \( A(x) = 4\sqrt{1-x^2} \); we know that \( x \) must be greater than or equal to zero, since \( x \) represents a length. We also need \( 1-x^2 \geq 0 \), since this expression occurs under a square root. In fact, to avoid Area = 0, we require \( x > 0 \) and \( 1-x^2 > 0 \).

Solve: \( 1-x^2 > 0 \)
\[ (1+x)(1-x) > 0 \]

Case1: \( 1+x > 0 \) and \( 1-x > 0 \)
\[ x > -1 \text{ and } x < 1 \]

Case2: \( 1+x < 0 \) and \( 1-x < 0 \)

   The monthly charge is $210 if 2000 minutes are used.

38. Answers will vary. From a graph, the domain can be found by visually locating the \( x \)-values for which the graph is defined. The range can be found in a similar fashion by visually locating the \( y \)-values for which the function is defined. If an equation is given, the domain can be found by locating any restricted values and removing them from the set of real numbers. The range can be found by using known properties of the graph of the equation, or estimated by means of a table of values.

b. From (a), the slope of the secant line joining $(-2, g(-2))$ and $(1, g(1))$ is $-1$. We use the point-slope form to find the equation of the secant line:

$$y - y_1 = m_{sec}(x - x_1)$$

$$y - 2 = -1(x - (-2))$$

$$y = -x - 2$$

$$y = -x$$

68. $g(x) = x^2 + 1$

a. Average rate of change of $g$ from $-1$ to $2$:

$$\frac{\Delta y}{\Delta x} = \frac{g(2) - g(-1)}{2 - (-1)} = \frac{5 - 2}{3} = \frac{3}{3} = 1$$

Therefore, the average rate of change of $g$ from $-1$ to $2$ is $1$.

b. From (a), the slope of the secant line joining $(-1, g(-1))$ and $(2, g(2))$ is $1$. We use the point-slope form to find the equation of the secant line:

$$y - y_1 = m_{sec}(x - x_1)$$

$$y - 2 = 1(x - (-1))$$

$$y = -x + 1$$

$$y = x + 3$$

69. $h(x) = x^2 - 2x$

a. Average rate of change of $h$ from $2$ to $4$:

$$\frac{\Delta y}{\Delta x} = \frac{h(4) - h(2)}{4 - 2} = \frac{8 - 0}{2} = \frac{8}{2} = 4$$

Therefore, the average rate of change of $h$ from $2$ to $4$ is $4$.

b. From (a), the slope of the secant line joining $(2, h(2))$ and $(4, h(4))$ is $4$. We use the point-slope form to find the equation of the secant line:

$$y - y_1 = m_{sec}(x - x_1)$$

$$y - 0 = 4(x - 2)$$

$$y = 4x - 8$$

70. $h(x) = -2x^2 + x$

a. Average rate of change from $0$ to $3$:

$$\frac{\Delta y}{\Delta x} = \frac{h(3) - h(0)}{3 - 0} = \frac{-15 - 0}{3} = \frac{-15}{3} = -5$$

Therefore, the average rate of change of $h$ from $0$ to $3$ is $-5$.

b. From (a), the slope of the secant line joining $(0, h(0))$ and $(3, h(3))$ is $-5$. We use the point-slope form to find the equation of the secant line:

$$y - y_1 = m_{sec}(x - x_1)$$

$$y - 0 = -5(x - 0)$$

$$y = -5x$$

71. $g(x) = x^3 - 27x$

$$g(-x) = (-x)^3 - 27(-x) = -x^3 + 27x$$

Since $g(-x) = -g(x)$, the function is odd.

b. Since $g(x)$ is odd then it is symmetric about the origin so there exist a local maximum at $x = -3$.

$$g(-3) = (-3)^3 - 27(-3) = -27 + 81 = 54$$

So there is a local maximum of $54$ at $x = -3$.

72. $f(x) = -x^3 + 12x$

a. $f(-x) = -(-x)^3 + 12(-x) = -x^3 - 12x$

$$= -(-x^3 + 12x) = -f(x)$$

Since $f(-x) = -f(x)$, the function is odd.

b. Since $f(x)$ is odd then it is symmetric about the origin so there exist a local maximum at $x = -3$.

$$f(-2) = -(-2)^3 + 12(-2) = 8 - 24 = -16$$

So there is a local maximum of $-16$ at $x = -2$.

73. $F(x) = -x^4 + 8x^2 + 8$
Section 2.3: Properties of Functions

74. \( G(x) = -x^4 + 32x^2 + 144 \)

a. \( G(-x) = -(-x)^4 + 32(-x)^2 + 144 \)
   \[= -x^4 + 32x^2 + 144\]
   \[= G(x)\]

Since \( G(-x) = G(x) \), the function is even.

b. Since the function is even, its graph has y-axis symmetry. The second local maximum is in quadrant II and is 24 and occurs at \( x = -2 \).

c. Because the graph has y-axis symmetry, the area under the graph between \( x = 0 \) and \( x = 3 \) bounded below by the x-axis is the same as the area under the graph between \( x = -3 \) and \( x = 0 \) bounded below the x-axis. Thus, the area is 47.4 square units.

76. \( C(t) = -0.002t^4 + 0.039t^3 - 0.285t^2 + 0.766t + 0.085 \)

Graph the function on a graphing utility and use the Maximum option from the CALC menu.

b. Use MINIMUM. Rounding to the nearest whole number, the average cost is minimized when approximately 10 lawnmowers are produced per hour.

c. The minimum average cost is approximately $239 per mower.

90. Answers will vary. See solution to Problem 89 for one possibility.

91. A function that is increasing on an interval can have at most one \( x \)-intercept on the interval. The graph of \( f \) could not "turn" and cross it again or it would start to decrease.

92. An increasing function is a function whose graph goes up as you read from left to right.
A decreasing function is a function whose graph goes down as you read from left to right.

93. To be an even function we need \( f(-x) = f(x) \) and to be an odd function we need \( f(-x) = -f(x) \). In order for a function to be both even and odd, we would need \( f(x) = -f(x) \). This is only possible if \( f(x) = 0 \).

94. The graph of \( y = 5 \) is a horizontal line.

95. Not necessarily. It just means \( f(5) > f(2) \). The function could have both increasing and decreasing intervals.

96. \[
\frac{f(x_2) - f(x_1)}{x_2 - x_1} = \frac{b-b}{x_2 - x_1} = 0

Chapter 2: Functions and Their Graphs

61. Each graph is that of \( y = x^2 \), but shifted horizontally.

\[
\begin{align*}
-6 & \quad -5 & \quad -4 & \quad -3 & \quad -2 & \quad -1 & \quad 0 & \quad 1 & \quad 2 & \quad 3 & \quad 4 & \quad 5 & \quad 6 \\
\text{y} & \quad \text{x}
\end{align*}
\]

The graph of \( y = -|x| \) is the reflection of the graph of \( y = |x| \) about the x-axis.

62. Each graph is that of \( y = |x| \), but either compressed or stretched vertically.

\[
\begin{align*}
-6 & \quad -5 & \quad -4 & \quad -3 & \quad -2 & \quad -1 & \quad 0 & \quad 1 & \quad 2 & \quad 3 & \quad 4 & \quad 5 & \quad 6 \\
\text{y} & \quad \text{x}
\end{align*}
\]

Multiplying a function by \(-1\) causes the graph to be a reflection about the x-axis of the original function's graph.

63. The graph of \( y = -x^2 \) is the reflection of the graph of \( y = x^2 \) about the x-axis.

64. The graph of \( y = \sqrt{-x} \) is the reflection about the y-axis of the graph of \( y = \sqrt{x} \).

\[
\begin{align*}
-5 & \quad -4 & \quad -3 & \quad -2 & \quad -1 & \quad 0 & \quad 1 & \quad 2 & \quad 3 & \quad 4 & \quad 5 \\
\text{y} & \quad \text{x}
\end{align*}
\]

The same type of reflection occurs when graphing \( y = 2x + 1 \) and \( y = 2(-x) + 1 \).

65. The graph of \( y = (x - 1)^3 + 2 \) is a shifting of the graph of \( y = x^3 \) one unit to the right and two
Section 2.5: Graphing Techniques: Transformations

66. The graphs of $y = x^n$, $n$ a positive even integer, are all U-shaped and open upward. All go through the points $(-1,1)$, $(0,0)$, and $(1,1)$. As $n$ increases, the graph of the function is narrower for $|x| > 1$ and flatter for $|x| < 1$.

67. The graphs of $y = x^n$, $n$ a positive odd integer, all have the same general shape. All go through the points $(-1,-1)$, $(0,0)$, and $(1,1)$. As $n$ increases, the graph of the function increases at a greater rate for $|x| > 1$ and is flatter around 0 for $|x| < 1$.

68. $f(x) = \begin{cases} 1 & \text{if } x \text{ is rational} \\ 0 & \text{if } x \text{ is irrational} \end{cases}$

Yes, it is a function.

Domain = $\{x \mid x \text{ is any real number}\}$ or $(-\infty, \infty)$

Range = $\{0, 1\}$ or $\{y \mid y = 0 \text{ or } y = 1\}$

y-intercept: $x = 0 \Rightarrow x$ is rational $\Rightarrow y = 1$

So the y-intercept is $y = 1$.

x-intercept: $y = 0 \Rightarrow x$ is irrational

So the graph has infinitely many x-intercepts, namely, there is an x-intercept at each irrational value of $x$.

$f(-x) = 1 = f(x)$ when $x$ is rational;

$f(-x) = 0 = f(x)$ when $x$ is irrational.

Thus, f is even.

The graph of $f$ consists of 2 infinite clusters of distinct points, extending horizontally in both directions. One cluster is located 1 unit above the x-axis, and the other is located along the x-axis.

69. For $0 < x < 1$, the graph of $y = x^r$, $r$ rational and $r > 0$, flattens down toward the x-axis as $r$ gets bigger. For $x > 1$, the graph of $y = x^r$ increases at a greater rate as $r$ gets bigger.

c. The local minimum can be found by using the Minimum feature from the CALC menu on a TI-84 Plus graphing calculator.
   ![Graph showing local minimum]
   The local minimum is approximately \(-10.39\) when \(x = 1.73.\)
   The local maximum can be found by using the Maximum feature from the CALC menu on a TI-84 Plus graphing calculator.
   ![Graph showing local maximum]
   The local maximum is approximately \(10.39\) when \(x = -1.73.\)

d. From the graph above, we see that \(f\) is initially increasing, decreasing between the two extrema, and increasing again at the end. Thus, \(f\) is increasing on the interval \((-4, 1.73)\) and on the interval \((1.73, 4)\). It is decreasing on the interval \((-1.73, 1.73)\).

e. \( y = f(x + 2) \) involves a shift to the left 2 units so we subtract 2 from each x-value. Therefore, we have the following:
   x-intercepts: \(-5, -2,\) and \(1\)
   local minimum: \(-10.39\) when \(x = -0.27\)
   local maximum: \(10.39\) when \(x = 3.73\)
   increasing on \((-6, -3.73)\) and \((-0.27, 2)\);
   decreasing on \((-3.73, -0.27)\).

f. \( y = 2f(x) \) involves a vertical stretch by a factor of 2 so we multiply each y-value by 2. Therefore, we have the following:
   x-intercepts: \(-3, 0,\) and \(3\)
   local minimum: \(-20.78\) when \(x = 1.73\)
   local maximum: \(20.78\) when \(x = -1.73\)

The x-intercepts are \(-2, 0, \text{ and } 2\).

c. The local minimum can be found by using the Minimum feature from the CALC menu on a TI-84 Plus graphing calculator.

![Minimum feature result](image)

The local minimum is approximately \(-3.08\) when \(x = 1.15\).

The local maximum can be found by using the Maximum feature from the CALC menu on a TI-84 Plus graphing calculator.

![Maximum feature result](image)

The local maximum is approximately \(3.08\) when \(x = -1.15\).

d. From the graph above, we see that \(f\) is initially increasing, decreasing between the two extrema, and increasing again at the end. Thus, \(f\) is increasing on the interval \((-3,-1.15)\) and on the interval \((1.15,3)\). It is decreasing on the interval \((-1.15,3)\).

e. \(y = f(x - 4)\) involves a shift to the right 4 units so we add 4 to each x-value. Therefore, we have the following:
- x-intercepts: \(2, 4, \text{ and } 6\)
- local minimum: \(-3.08\) when \(x = 5.15\)
- local maximum: \(3.08\) when \(x = 2.85\)
- increasing on \((1.285, 5.15)\) and \((-3.08, 5.15)\);
- decreasing on \((-3.08, 0.35)\).

f. \(y = f(2x)\) involves a horizontal compression by a factor of 2 so we divide each x-value by 2. Therefore, we have the following:
- x-intercepts: \(-1, 0, \text{ and } 1\)
- local minimum: \(-3.08\) when \(x = 0.575\)
- local maximum: \(3.08\) when \(x = -0.575\)

- decreasing on \((-0.575, 0.575)\).

g. \(y = -f(x)\) involves a reflection about the x-axis. Therefore, we have the following:
- x-intercepts: \(-2, 0, \text{ and } 2\)
- local minimum: \(-3.08\) when \(x = -1.15\)
- local maximum: \(3.08\) when \(x = 1.15\)
- increasing on \((-1.15, 1.15)\);
- decreasing on \((-3, -1.15)\) and \((1.15, 3)\).

75. \(f(x) = x^2 + 2x\)

![Graph of f(x) = x^2 - 6x](image)
77. $f(x) = x^2 - 8x + 1$
   $f(x) = (x^2 - 8x + 16) + 1 - 16$
   $f(x) = (x - 4)^2 - 15$
Using $f(x) = x^2$, shift right 4 units and shift down 15 units.

78. $f(x) = x^2 + 4x + 2$
   $f(x) = (x^2 + 4x + 4) + 2 - 4$
   $f(x) = (x + 2)^2 - 2$
Using $f(x) = x^2$, shift left 2 units and shift down 2 units.

79. $f(x) = 2x^2 - 12x + 19$
   $= 2(x^2 - 6x) + 19$
   $= 2(x^2 - 6x + 9) + 19 - 18$
   $= 2(x - 3)^2 + 1$
Using $f(x) = x^2$, shift right 3 units, vertically stretch by a factor of 2, and then shift up 1 unit.

80. $f(x) = 3x^2 + 6x + 1$
   $= 3(x^2 + 2x + 1) + 1 - 1$
   $= 3(x + 1)^2 - 2$
Using $f(x) = x^2$, shift left 1 unit, vertically stretch by a factor of 3, and shift down 2 units.

81. $f(x) = -3x^2 - 12x - 17$
   $= -3(x^2 + 4x) - 17$
   $= -3(x^2 + 4x + 4) - 17 + 12$
   $= -3(x + 2)^2 - 5$
Using $f(x) = x^2$, shift left 2 units, stretch vertically by a factor of 3, reflect about the x-axis, and shift down 5 units.

82. \( f(x) = -2x^2 - 12x - 13 \)
\[ = -2\left(x^2 + 6x\right) - 13 \]
\[ = -2\left(x^2 + 6x + 9\right) - 13 + 18 \]
\[ = -2(x + 3)^2 + 5 \]
Using \( f(x) = x^2 \), shift left 3 units, stretch vertically by a factor of 2, reflect about the \( x \)-axis, and shift up 3 units.

83. \( y = (x-c)^2 \)

85. a. From the graph, the thermostat is set at 72°F during the daytime hours. The thermostat appears to be set at 65°F overnight.

b. To graph \( y = T(t) - 2 \), the graph of \( T(t) \) is shifted down 2 units. This change will lower the temperature in the house by 2 degrees.

c. To graph \( y = T(t + 1) \), the graph of \( T(t) \) should be shifted left one unit. This change will cause the program to switch between the daytime temperature and overnight temperature one hour sooner. The home will begin warming up at 5am instead of 6am and will begin cooling down at 8pm instead.
86. a. \( R(0) = 170.7(0)^2 + 1373(0) + 1080 = 1080 \)
The estimated worldwide music revenue for 2005 is $1080 million.

\[ R(3) = 170.7(3)^2 + 1373(3) + 1080 \]
\[ = 6735.3 \]
The estimated worldwide music revenue for 2008 is $6735.3 million.

\[ R(5) = 170.7(5)^2 + 1373(5) + 1080 \]
\[ = 12,212.5 \]
The estimated worldwide music revenue for 2010 is $12,212.5 million.

b. \( r(x) = R(x - 5) \)
\[ = 170.7(x - 5)^2 + 1373(x - 5) + 1080 \]
\[ = 170.7(x^2 - 10x + 25) + 1373(x - 5) + 1080 \]
\[ = 170.7x^2 - 1707x + 4267.5 + 1373x - 6865 + 1080 \]
\[ = 170.7x^2 - 334x - 1517.5 \]

c. The graph of \( r(x) \) is the graph of \( R(x) \) shifted 5 units to the left. Thus, \( r(x) \) represents the estimated worldwide music revenue, \( x \) years after 2000.

\[ r(5) = 170.7(5)^2 - 334(5) - 1517.5 = 1080 \]
The estimated worldwide music revenue for 2005 is $1080 million.

\[ r(8) = 170.7(8)^2 - 334(8) - 1517.5 \]
\[ = 6735.3 \]
The estimated worldwide music revenue for 2008 is $6735.3 million.

\[ r(10) = 170.7(10)^2 - 334(10) - 1517.5 \]
\[ = 12,212.5 \]
The estimated worldwide music revenue for 2010 is $12,212.5 million.

d. In \( r(x) \), \( x \) represents the number of years after 2000 (see the previous part).

e. Answers will vary. One advantage might be that it is easier to determine what value should be substituted for \( x \) when using \( r(x) \) instead of \( R(x) \) to estimate worldwide music revenue.

b. The graph of \( y = -2f(x-2) + 1 \) is the graph of \( y = f(x) \) but shifted right 2 units, stretched vertically by a factor of 2, reflected about the \( x \)-axis, and shifted up 1 unit. Thus, the point \((1,3)\) becomes the point \((3,-5)\).

c. The graph of \( y = f(2x+3) \) is the graph of \( y = f(x) \) but shifted left 3 units and horizontally compressed by a factor of 2. Thus, the point \((1,3)\) becomes the point \((-1,3)\).

93. a. The graph of \( y = g(x+1) - 3 \) is the graph of \( y = g(x) \) but shifted left 1 unit and down 3 units. Thus, the point \((-3,5)\) becomes the point \((-4,2)\).

b. The graph of \( y = -3g(x-4) + 3 \) is the graph of \( y = g(x) \) but shifted right 4 units, stretched vertically by a factor of 3, reflected about the \( x \)-axis, and shifted up 3 units. Thus, the point \((-3,5)\) becomes the point \((-4,5)\).

c. The graph of \( y = g(3x+9) \) is the graph of \( y = f(x) \) but shifted left 9 units and horizontally compressed by a factor of 3. Thus, the point \((-3,5)\) becomes the point \((-4,5)\).

94. The graph of \( y = 4f(x) \) is a vertical stretch of the graph of \( f \) by a factor of 4, while the graph of \( y = f(4x) \) is a horizontal compression of the graph of \( f \) by a factor of \( \frac{1}{4} \).

95. The graph of \( y = f(x) - 2 \) will shift the graph of \( y = f(x) \) down by 2 units. The graph of \( y = f(x-2) \) will shift the graph of \( y = f(x) \) to the right by 2 units.

96. The graph of \( y = \sqrt{x} \) is the graph of \( y = \sqrt{x} \) but reflected about the \( y \)-axis. Therefore, our region is simply rotated about the \( y \)-axis and does not change shape. Instead of the region being bounded on the right by \( x = 4 \), it is bounded on the left by \( x = -4 \). Thus, the area of the second region would also be \( \frac{16}{3} \) square units.

$$A = \frac{1}{2}bh$$
where $b$ = base, $h$ = height. From the figure, we know that $b = x$ and $h = y$. Expressing the area of the triangle as a function of $x$, we have:
$$A(x) = \frac{1}{2}xy = \frac{1}{2}x(\sqrt{x}) = \frac{1}{2}x^{\frac{3}{2}}.$$

6. By definition, a triangle has area

\( b = x \) and \( h = y \). Expressing the area of the triangle as a function of \( x \), we have:
\[
A(x) = \frac{1}{2} x y = \frac{1}{2} x \left(9 - x^2\right) = \frac{9}{2} x - \frac{1}{2} x^3.

11. a. \( C = \text{circumference}, A = \text{total area}, \)
\( r = \text{radius}, x = \text{side of square} \)
\[
C = 2\pi r = 10 - 4x \quad \Rightarrow \quad r = \frac{5 - 2x}{\pi}

12. a. \( C = \) circumference, \( A = \) total area, \( r = \) radius, \( x = \) side of equilateral triangle

\[ C = 2\pi r = 10 - 3x \Rightarrow r = \frac{10 - 3x}{2\pi} \]

The height of the equilateral triangle is \( \sqrt{3}x/2 \).

Total Area = \( \text{area}_{\text{triangle}} + \text{area}_{\text{circle}} \)
\[ = \frac{1}{2} x \left( \frac{\sqrt{3}}{2} x \right) + \pi r^2 \]
\[ A(x) = \frac{\sqrt{3}}{4} x^2 + \pi \left( \frac{10 - 3x}{2\pi} \right)^2 \]
\[ = \frac{\sqrt{3}}{4} x^2 + \frac{100 - 60x + 9x^2}{4\pi} \]

13. a. Since the wire of length \( x \) is bent into a circle, the circumference is \( x \). Therefore, \( C(x) = x \).

b. Since \( C = x = 2\pi r \), \( r = \frac{x}{2\pi} \).
\[ A(x) = \pi r^2 = \pi \left( \frac{x}{2\pi} \right)^2 = \frac{x^2}{4\pi} \]

14. a. Since the wire of length \( x \) is bent into a square, the perimeter is \( x \). Therefore, \( p(x) = x \).

b. Since \( P = x = 4s \), \( s = \frac{1}{4} x \), we have
\[ A(x) = s^2 = \left( \frac{1}{4} x \right)^2 = \frac{1}{16} x^2 \]

15. a. \( A = \) area, \( r = \) radius; diameter = \( 2r \)
\[ A(r) = (2r)(r) = 2r^2 \]

b. \( p = \) perimeter
\[ p(r) = 2(2r) + 2r = 6r \]

16. \( C = \) circumference, \( r = \) radius; \( x = \) length of a side of the triangle

Since \( \Delta ABC \) is equilateral, \( EM = \frac{\sqrt{3}x}{2} \).
Therefore, \( OM = \frac{\sqrt{3}x}{2} - OE = \frac{\sqrt{3}x}{2} - r \)

In \( \triangle OAM \), \( r^2 = \left(\frac{x}{2}\right)^2 + \left(\frac{\sqrt{3}x}{2} - r\right)^2 \)

\[ r^2 = \frac{x^2}{4} + \frac{3}{4}x^2 - \sqrt{3}rx + r^2 \]

\[ \sqrt{3}rx = x^2 \]

\[ r = \frac{x}{\sqrt{3}} \]

Therefore, the circumference of the circle is

\[ C(x) = 2\pi r = 2\pi \left(\frac{x}{\sqrt{3}}\right) = \frac{2\pi\sqrt{3}}{3}x \]

17. Area of the equilateral triangle

\[ A = \frac{1}{2}x \cdot \frac{\sqrt{3}}{2}x = \frac{\sqrt{3}}{4}x^2 \]

From problem 16, we have \( r^2 = \frac{x^2}{3} \).

Area inside the circle, but outside the triangle:

\[ A(x) = \pi r^2 - \frac{\sqrt{3}}{4}x^2 \]

\[ = \frac{x^2}{3} - \frac{\sqrt{3}}{4}x^2 = \left(\frac{\pi}{3} - \frac{\sqrt{3}}{4}\right)x^2 \]

18. \( d^2 = d_1^2 + d_2^2 \)

\[ d^2 = (30t)^2 + (40t)^2 \]

\[ d(t) = \sqrt{900t^2 + 1600t^2} = \sqrt{2500t^2} = 50t \]

\[ d_2 = 40t \quad d_1 = 30t \]

19. a. \( d^2 = d_1^2 + d_2^2 \)

\[ d^2 = (2 - 30t)^2 + (3 - 40t)^2 \]

\[ d(t) = \sqrt{(2 - 30t)^2 + (3 - 40t)^2} \]

\[ = \sqrt{4 - 120t + 900t^2 + 9 - 240t + 1600t^2} \]

\[ = \sqrt{2500t^2 - 360t + 13} \]

20. \( r = \) radius of cylinder, \( h = \) height of cylinder, \( V = \) volume of cylinder

\[ r^2 + \left(\frac{h}{2}\right)^2 = R^2 \Rightarrow r^2 + \frac{h^2}{4} = R^2 \Rightarrow r^2 = R^2 - \frac{h^2}{4} \]

\[ V = \pi r^2 h \]

\[ V(h) = \pi \left( R^2 - \frac{h^2}{4} \right)h = \pi h \left( R^2 - \frac{h^2}{4} \right) \]

21. \( r = \) radius of cylinder, \( h = \) height of cylinder, \( V = \) volume of cylinder

By similar triangles:

\[ \frac{H}{R} = \frac{H - h}{r} \]

\[ Hr = R(H - h) \]

\[ V = \pi r^2 h = \pi r^2 \left( \frac{H(R - r)}{R} \right) = \frac{\pi H(R - r)r^2}{R} \]

   a. \( f(2) = \sqrt{2^2 - 4} = \sqrt{4 - 4} = \sqrt{0} = 0 \)
   b. \( f(-2) = \sqrt{(-2)^2 - 4} = \sqrt{4 - 4} = \sqrt{0} = 0 \)
   c. \( f(-x) = \sqrt{(-x)^2 - 4} = \sqrt{x^2 - 4} \)
   d. \( -f(x) = -\sqrt{x^2 - 4} \)
   e. \( f(x - 2) = \sqrt{(x - 2)^2 - 4} \)
      = \sqrt{x^2 - 4x + 4 - 4} \)

   c. \( f(-x) = \frac{(-x)^2 - 4}{(-x)^2} = \frac{x^2 - 4}{x^2} \)
   d. \( -f(x) = -\left( \frac{x^2 - 4}{x^2} \right) = \frac{4 - x^2}{x^2} = -\frac{x^2 - 4}{x^2} \)
   e. \( f(x - 2) = \frac{(x - 2)^2 - 4}{(x - 2)^2} = \frac{x^2 - 4x + 4 - 4}{(x - 2)^2} \)
      = \frac{x^2 - 4x}{(x - 2)^2} = \frac{x(x - 4)}{(x - 2)^2} \)
   f. \( f(2x) = \frac{(2x)^2 - 4}{(2x)^2} = \frac{4x^2 - 4}{4x^2} \)

Chapter 2 Review Exercises

24. \( f(x) = 8x^2 - x \)
a. \[ \frac{f(2) - f(1)}{2 - 1} = \frac{8(2)^2 - 2 - [8(1)^2 - 1]}{1} \]
\[ = 32 - 2 - (7) = 23 \]
b. \[ \frac{f(1) - f(0)}{1 - 0} = \frac{8(1)^2 - 1 - [8(0)^2 - 0]}{1} \]
\[ = 8 - 1 - (0) = 7 \]
c. \[ \frac{f(4) - f(2)}{4 - 2} = \frac{8(4)^2 - 4 - [8(2)^2 - 2]}{2} \]
\[ = \frac{128 - 4 - (30)}{2} = \frac{94}{2} = 47 \]

25. \( f(x) = 2 - 5x \)
\[ \frac{f(3) - f(2)}{3 - 2} = \frac{[2 - 5(3)] - [2 - 5(2)]}{3 - 2} \]
\[ = \frac{(2 - 15) - (2 - 10)}{1} \]
\[ = -13 - (-8) = -5 \]

26. \( f(x) = 3x - 4x^2 \)
\[ \frac{f(3) - f(2)}{3 - 2} = \frac{[3(3) - 4(3)^2] - [3(2) - 4(2)^2]}{3 - 2} \]
\[ = \frac{9 - 36 - (6 - 16)}{1} \]
\[ = -27 + 10 = -17 \]

Chapter 2 Test

1. a. \( \{(2,5),(4,6),(6,7),(8,8)\} \)
   This relation is a function because there are no ordered pairs that have the same first element and different second elements.
   Domain: \( \{2,4,6,8\} \)
   Range: \( \{5,6,7,8\} \)

b. \( \{(1,3),(4,-2),(-3,5),(1,7)\} \)
   This relation is not a function because there are two ordered pairs that have the same first element but different second elements.

c. This relation is not a function because the graph fails the vertical line test.

d. This relation is a function because it passes the vertical line test.
   Domain: \( \{x \mid x \text{ is any real number}\} \)
   Range: \( \{y \mid y \geq 2\} \text{ or } [2, \infty) \)

2. \( f(x) = \sqrt{4-5x} \)
   The function tells us to take the square root of \( 4-5x \). Only nonnegative numbers have real square roots so we need \( 4-5x \geq 0 \).
   \[ 4-5x \geq 0 \]
   \[ 4-5x-4 \geq 0-4 \]
   \[ -5x \geq -4 \]
   \[ -5x \leq -4 \]
   \[ x \leq \frac{4}{5} \]
   Domain: \( \left\{ x \mid \left[ x \leq \frac{4}{5}\right] \text{ or } \left(-\infty, \frac{4}{5}\right]\right\} \)
   \[ f(-1) = \sqrt{4-5(-1)} = \sqrt{4+5} = \sqrt{9} = 3 \]

3. \( g(x) = \frac{x+2}{|x+2|} \)
   The function tells us to divide \( x+2 \) by \( |x+2| \).
   Division by 0 is undefined, so the denominator can never equal 0. This means that \( x \neq -2 \).
   Domain: \( \{x \mid x \neq -2\} \)
   \[ g(-1) = \frac{(-1)+2}{|(-1)+2|} = \frac{1}{|1|} = 1 \]
4. \( h(x) = \frac{x - 4}{x^2 + 5x - 36} \)

The function tells us to divide \( x - 4 \) by \( x^2 + 5x - 36 \). Since division by 0 is not defined, we need to exclude any values which make the denominator 0.

\( x^2 + 5x - 36 = 0 \)

\((x + 9)(x - 4) = 0 \)

\( x = -9 \) or \( x = 4 \)

Domain: \( \{ x \mid x \neq -9, x \neq 4 \} \)

(note: there is a common factor of \( x - 4 \) but we must determine the domain prior to simplifying)

\( h(-1) = \frac{(-1) - 4}{(-1)^2 + 5(-1) - 36} = \frac{-5}{-40} = \frac{1}{8} \)

5. a. To find the domain, note that all the points on the graph will have an \( x \)-coordinate between \(-5\) and \(5\), inclusive. To find the range, note that all the points on the graph will have a \( y \)-coordinate between \(-3\) and \(3\), inclusive.

Domain: \( \{ x \mid -5 \leq x \leq 5 \} \) or \([-5, 5]\]

Range: \( \{ y \mid -3 \leq y \leq 3 \} \) or \([-3, 3]\]

b. The intercepts are \((0, 2)\), \((-2, 0)\), and \((2, 0)\).

x-intercepts: \(-2, 2\)

y-intercept: 2

c. \( f(1) \) is the value of the function when \( x = 1 \). According to the graph, \( f(1) = 3 \).

d. Since \((-5, -3)\) and \((3, -3)\) are the only points on the graph for which \( y = f(x) = -3 \), we have \( f(x) = -3 \) when \( x = -5 \) and \( x = 3 \).

e. To solve \( f(x) < 0 \), we want to find \( x \)-values such that the graph is below the \( x \)-axis. The graph is below the \( x \)-axis for values in the domain that are less than \(-2\) and greater than \(2\). Therefore, the solution set is \( \{ x \mid -5 \leq x < -2 \text{ or } 2 < x \leq 5 \} \).

In interval notation we would write the solution set as \([-5, -2) \cup (2, 5]\).

6. \( f(x) = -x^4 + 2x^3 + 4x^2 - 2 \)

We set \( X_{\text{min}} = -5 \) and \( X_{\text{max}} = 5 \). The standard Ymin and Ymax will not be good enough to see the whole picture so some adjustment must be made.

We see that the graph has a local maximum of \(-0.86\) (rounded to two places) when \( x = -0.85 \) and another local maximum of 15.55 when \( x = 2.35 \). There is a local minimum of \(-2\) when \( x = 0 \). Thus, we have

Local maxima: \( f(-0.85) = -0.86 \)

\( f(2.35) = 15.55 \)

Local minima: \( f(0) = -2 \)

The function is increasing on the intervals \((-5, -0.85)\) and \((0, 2.35)\) and decreasing on the intervals \((-0.85, 0)\) and \((2.35, 5)\).

7. a. \( f(x) = \begin{cases} 2x + 1 & x < -1 \\ x - 4 & x \geq -1 \end{cases} \)

To graph the function, we graph each “piece”. First we graph the line \( y = 2x + 1 \) but only keep the part for which \( x < -1 \). Then we plot the line \( y = x - 4 \) but only keep the part for which \( x \geq -1 \).

b. To find the intercepts, notice that the only piece that hits either axis is \( y = x - 4 \).
Chapter 2: Functions and Their Graphs

1. \( y = x - 4 \) \quad y = x - 4

2. \( y = 0 - 4 \quad 0 = x - 4 \)

3. \( y = -4 \quad 4 = x \)

The intercepts are \((0, -4)\) and \((4, 0)\).

c. To find \( g(-5) \) we first note that \( x = -5 \) so we must use the first “piece” because \(-5 < -1\).

\[ g(-5) = 2(-5) + 1 = -10 + 1 = -9 \]

d. To find \( g(2) \) we first note that \( x = 2 \) so we must use the second “piece” because \( 2 \geq -1 \).

\[ g(2) = 2 - 4 = -2 \]

8. The average rate of change from 3 to 4 is given by

\[ \Delta y = \frac{f(4) - f(3)}{4 - 3} \]

\[ = \frac{(3(4)^2 - 2(4) + 4) - (3(3)^2 - 2(3) + 4)}{4 - 3} \]

\[ = \frac{44 - 25}{1} = 19 \]

9. a. \( f - g = (2x^2 + 1) - (3x - 2) \)

\[ = 2x^2 + 1 - 3x + 2 = 2x^2 - 3x + 3 \]

b. \( f \cdot g = (2x^2 + 1)(3x - 2) = 6x^3 - 4x^2 + 3x - 2 \)

c. \( f(x + h) - f(x) = (2(x + h)^2 + 1) - (2x^2 + 1) \)

\[ = (2x^2 + 2xh + h^2 + 1) - (2x^2 + 1) \]

\[ = 2x^2 + 4xh + h^2 + 1 - 2x^2 - 1 \]

\[ = 4xh + 2h^2 \]

10. a. The basic function is \( y = x^3 \) so we start with the graph of this function.

Next we shift this graph 1 unit to the left to obtain the graph of \( y = (x + 1)^3 \).

b. The basic function is \( y = |x| \) so we start with the graph of this function.
Chapter 2 Chapter Test

Next we shift this graph 4 units to the left to obtain the graph of $y = |x + 4|$.

Next we shift this graph up 2 units to obtain the graph of $y = |x + 4| + 2$.

11. a. $r(x) = -0.115x^2 + 1.183x + 5.623$

For the years 1992 to 2004, we have values of $x$ between 0 and 12. Therefore, we can let $X_{\text{min}} = 0$ and $X_{\text{max}} = 12$. Since $r$ is the interest rate as a percent, we can try letting $Y_{\text{min}} = 0$ and $Y_{\text{max}} = 10$.

The highest rate during this period appears to be 8.67%, occurring in 1997 ($x = 5$).

b. For 2010, we have $x = 2010 - 1992 = 18$.

\[ r(18) = -0.115(18)^2 + 1.183(18) + 5.623 \]

\[ r(18) = -10.343 \]

The model predicts that the interest rate will be $-10.343\%$. This is not a reasonable value since it implies that the bank would be paying interest to the borrower.

12. a. Let $x =$ width of the rink in feet. Then the length of the rectangular portion is given by $2x - 20$. The radius of the semicircular portions is half the width, or $r = \frac{x}{2}$.

To find the volume, we first find the area of the surface and multiply by the thickness of the ice. The two semicircles can be combined to form a complete circle, so the area is given by

\[ A = l \cdot w + \pi r^2 \]

\[ = (2x - 20)(x) + \pi \left(\frac{x}{2}\right)^2 \]

\[ = 2x^2 - 20x + \frac{\pi x^2}{4} \]

We have expressed our measures in feet so we need to convert the thickness to feet as well.

0.75 in $\cdot \frac{1 \text{ ft}}{12 \text{ in}} = 0.0625 \text{ ft} = \frac{1}{15} \text{ ft}$

Now we multiply this by the area to obtain the volume. That is,

\[ V(x) = \frac{1}{15} \left(2x^2 - 20x + \frac{\pi x^2}{4}\right) \]

\[ V(x) = \frac{x^2}{8} - \frac{5x}{4} + \frac{\pi x^2}{64} \]

b. If the rink is 90 feet wide, then we have $x = 90$.

Chapter 2: Functions and Their Graphs

\[ V(90) = \frac{90^2}{8} - \frac{5(90)}{4} + \frac{\pi(90)^2}{64} = 1297.61 \]

The volume of ice is roughly 1297.61 ft³.
